

AP Browser Connect — Extension Installation

One-time manual step (Chrome requires it). Everything else is handled by the installer.

Step 1 — Open the extensions page

1. Open Google Chrome.
2. Type `chrome://extensions` in the address bar and press Enter.

Step 2 — Enable Developer mode

1. Toggle **Developer mode** (top-right corner of the page).
2. The toolbar row with **Load unpacked**, **Pack extension**, and **Update** buttons appears.

Step 3 — Load the extension

1. Click **Load unpacked**.
2. In the file picker, select the `extension` folder that ships next to this PDF.
3. The **AP Browser Connect** card appears in the list. (Optional) Pin it to the toolbar via the puzzle icon.

Multiple profiles: repeat Step 3 in every Chrome profile you want `ap-browser` to control. The installer detects the extension across all profiles automatically.

Step 4 — Done

1. That's it. The installer you launched is watching for the extension and continues automatically the moment it appears — no need to re-run it.
2. If the installer already timed out, just run `bash install/install.sh` again; it will pick up the extension immediately.

Step 5 — Verify

1. Run `ap-browser ping`. Success looks like: `{"ok":true,"data":{"pong":true},...}`
2. If prompted, open the extension popup and set a profile label (e.g. *Personal*, *Work*).
